

On some systems, we have to use additional components to assure that your gutters are installed properly.

Strap System

Where there is either no fascia or detailed crown molding or a severe angle, we use a hidden strap system. The support brackets are mounted underneath the shingles. The gutter straps are secured from the gutter brackets to the support brackets. We try hard to avoid installing straps over the roof.

Wedges

Where the fascia is at an angle, we use an aluminum wedge to make up the difference in the angle of the fascia. These wedges are behind the gutter and are not visible when looking at the gutter system.

Wood Build Out

Where the fascia has a step to it, either flat or at an angle, we use wood build out to fill in the step. We use either pre primed and painted wood or composite material. The benefit of composite material is that it will never rot, however it does not work in every application so speak to your gutter consultant about your specific requirements.
